

## Influenza Surveillance Report

January 27, 2010

### **Outpatient Influenza-Like Illness (ILI) Surveillance**

- For the week ending 1/23/10, visits to doctors for influenza-like illness (ILI) in New Mexico increased from 2.8% to 3.3% (Figure 1).
- The Central, Southeast and Southwest regions experienced increases in the percentage of outpatient visits for ILI while the Northeast region remained the same and the Northwest region experienced a decrease (Figure 2). The percentages of outpatient visits for ILI in New Mexico regions were: 1.3% in Northeast, 3.4% in Northwest, 6.2% in Central, 1.9% in Southwest and 6.3% in Southeast.

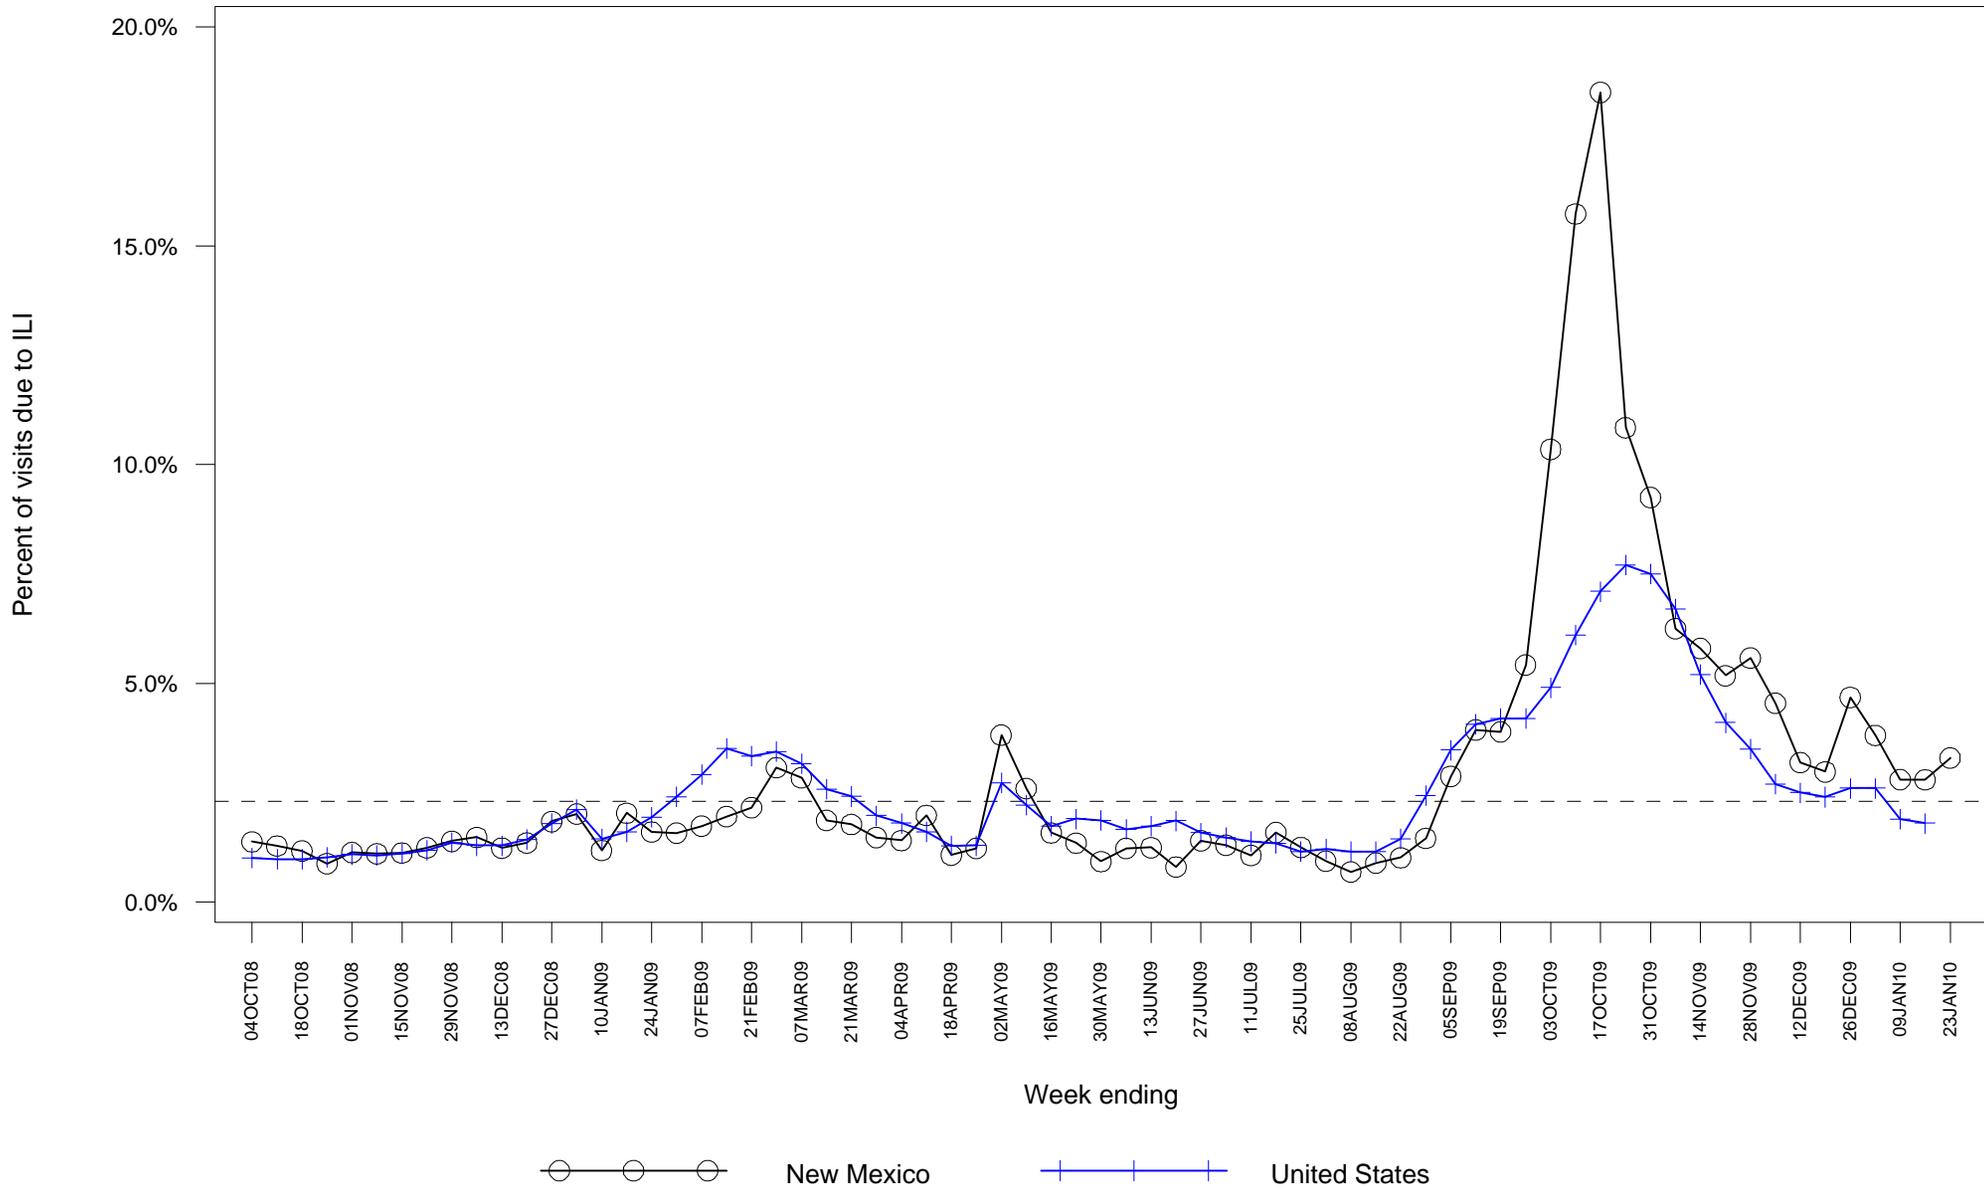

### **Laboratory-confirmed Influenza Hospitalization Surveillance**

- Starting 10/12/09 the case definition for laboratory-confirmed influenza hospitalizations was expanded to include patients with positive rapid influenza and influenza fluorescent antibody tests. Previously the case definition only considered positive RT-PCR and viral culture results as confirmatory. This change was made to more accurately represent the burden of influenza-related hospitalizations in New Mexico.
- As of 1/27/10, there have been 1007 hospitalizations related to laboratory-confirmed influenza infection in New Mexico, an increase of 6 from last week. No hospitalizations occurred during the week ending 1/23/10 (Figure 3). Table 1 summarizes hospitalizations by county of residence.

### **Laboratory-confirmed Influenza Death Surveillance**

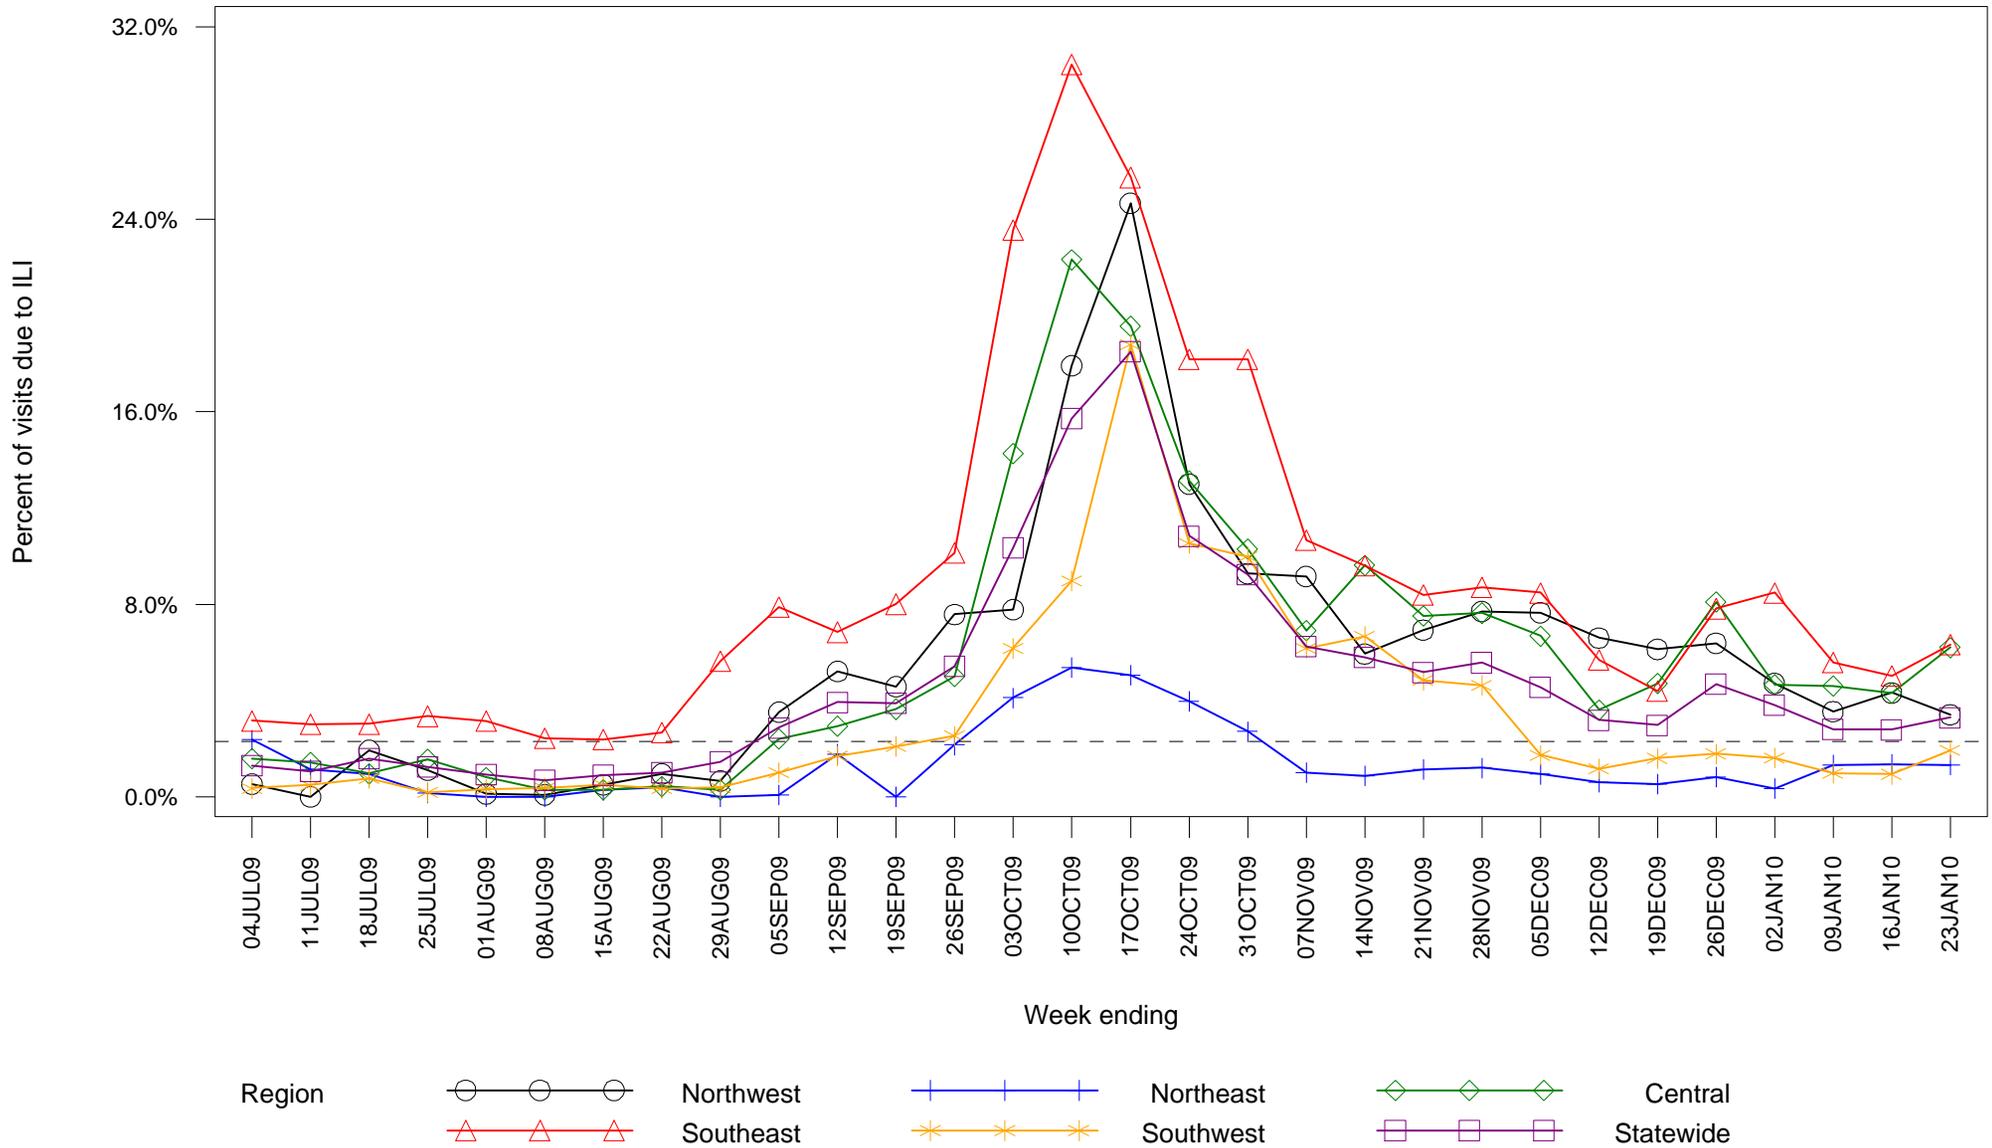

- As of 1/27/10, there have been 52 deaths related to laboratory-confirmed influenza infection in New Mexico. One new death was reported this week: an 82 year-old male from Bernalillo County with chronic medical conditions. Table 2 summarizes deaths by county of residence.

# Figure 1: Percent of sentinel provider outpatient visits due to influenza-like illness (ILI) New Mexico and United States

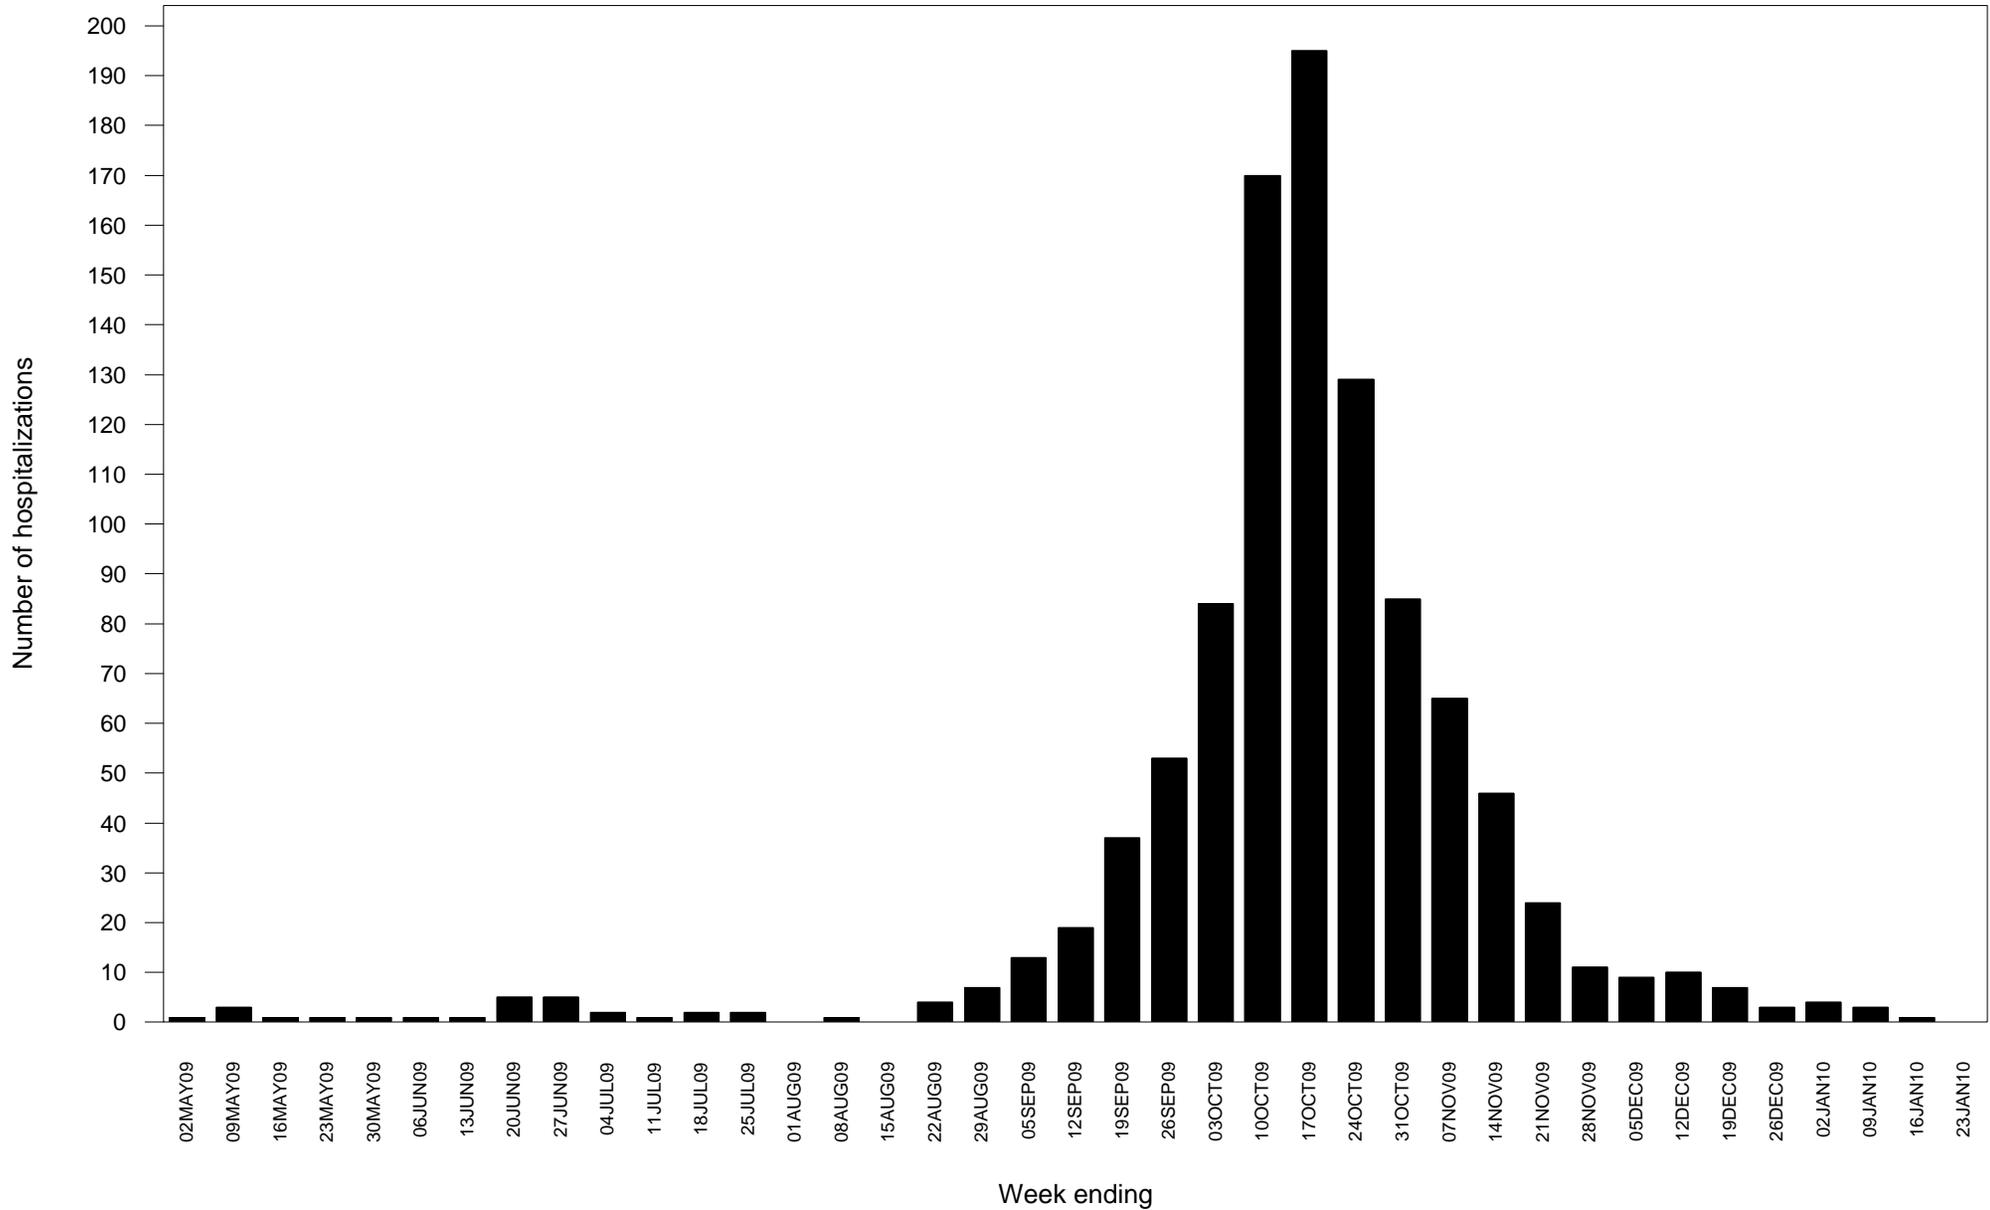

Dashed line indicates national baseline value of 2.3%. Reporting of US data is delayed a week.

# Figure 2: Percent of sentinel provider outpatient visits due to influenza-like illness (ILI) New Mexico

Dashed line indicates national baseline value of 2.3%. The Southeast region consistently reports ILI visit percentages that are higher than other regions so differences between regions should be interpreted with caution.

**Figure 3: Laboratory-confirmed influenza hospitalizations by admission date  
New Mexico**

Report date substituted for admission date for 14 hospitalizations for which admission date has not yet been determined.

**Table 1: Cumulative laboratory-confirmed influenza hospitalizations by county of residence  
New Mexico**

<b>County</b>	<b>Number</b>
<b>Bernalillo County</b>	250
<b>Catron County</b>	4
<b>Chaves County</b>	17
